Software Feature

ZFS Based Operating System

- ZFS provides ZFS checksum and Copies on Write technology to keep data complete.
- ZFS checksum - ZFS will calculate the checksum and compare it with the original checksum, if not match, it automatically repairs the damage, using data from the other mirror to ensure the correctness of the data.
 - Copy on Write - This mechanism guarantees that the old data is safely preserved in case of power loss or system crash that in other cases would result in loss of data.

Comprehensive Business Backup Function

QSM server covers local and remote snapshots scheduled, giving you the flexibility and confidence to work worry-free. Also provides synchronous multi-site data replication to make sure business continuity.

- XMirror - Regularly synchronizes a volume or the contents of a folder between multiple unified storage devices.
- Snapshot and Replica - Snapshots record the status of shared folders and iSCSI LUNs as changes happen on write, and replication can transfer the changes between different devices.
- Remote Replication - Remote Backup Data copies can be distributed to your trusted storage locations through real-time remote backup.
- XReplicator - XReplicator is a free utility that is provided to help you easily backup an image of a disk, partition, folder, or file; or entire PC as a bare-metal backup.
- Cloud Backup and S3 - QSM provides cloud services backup ensures that you can backup your data to multiple cloud services such as Amazon S3, iCloud S3, and S3 compliant services.

Enlarge Storage Capacity

QSM server provides deduplication, compression, and thin provisioning functions to save storage space and achieve effective cost control.

- Inline Deduplication - Block-level function that checks the block similarity of data and auto removes the redundant data object to reduce the usage of storage capacity.
- Compression - Reducing data for your storage, helping ITs to reduce the amount of storage you need to purchase and maintain.
- Auto Tiering (for block level) - Demanding workloads of your business applications could be dramatically reduced and the performance increased.
- Thin Provisioning - lets various services and applications use the same storage space without limiting how much of the quota can be used by each.

Facing Modern Security Threats Proactively

QSM secures your current data by delivers an actionable, proactive protection strategy to minimize potential risks.

- WORM (Write Once Read Many) - WORM can protect your data from encryption-based ransomware that installs covertly on a victim's system and encrypt their files, making them inaccessible.
- SED (Self-Encrypting Drive) - With the technology, even if the physical drive is stolen or misplaced, the data on it remains protected against data breach by generating the AK (Authentication Key) to prevent unauthorized access.
- Pool Encryption with AES-256 - QSM supports up to AES 256-bit encryption for internal drives and external USB / eSATA drives.
- Memory Cache Protection (for XCubeNXT series) - This function will safely transfer the memory cache data to a non-volatile flash device when an unexpected power loss happens.

Powerful Storage Capacity

QSM is a ZFS based file system, ZFS is a “128-bit” file system, 128 bits is the largest size address and it can manage almost unlimited storage capacity. Each ZFS storage pool, file system, and a single file can store billions of files and snapshots. This feature allows you to upgrade your business without the need to purchase additional equipment, and unlimited capacity is suitable for all kinds of applications.

Virtualization Ready

QSM is verified with VMware® Ready™ and Microsoft® Hyper-V™ certified. No matter which virtualization environment you've adopted, the QSM is a practical and efficient storage system for you to deploy in any virtualization platform. QSM can be used for primary storage repositories and as a backup to existing primary storage. As a backup storage device, the QSM supports a comprehensive list of 3rd-party virtual machine backup software to ensure that your VMs and data are never at risk of loss.

Hypervisor Manager

In QSM, the built-in Hypervisor Manager is an easy-to-use application enabling you to create and manage virtual machines that run directly on the unified storage. Being capable of hosting multiple virtualized environments ensures various customized services and applications are well presented at the same time without the additional hardware investment. Additionally, those virtual machines are isolated reducing the risk of potential data leaks or operation interference. These features make the QSM an ideal multi-tenant environment for deploying business applications.

RESTful API

QSM provides the standard RESTful API. The system can be deployed into the IT management system using RESTful API and let IT managers continuously use the existing management tool, even the first-time user can finish the management job confidently, which considerably reduce the learning cost for organizations.

Advanced Technology

QSAN Always-On Technology

Keep your business on. With the growth of data usage, downtime can cost a huge cost for your business. QSM ensures business continuity by reducing downtime while keeping critical applications and data online and accessible by those who rely on them.

Simple Business Continuity with Active Cluster

Clustered controller design allows for the complete failure of a controller or any controller component without impacting operations. Both controllers concurrently provide storage services in real-time. If one controller fails, the other controller can transparently seamlessly take over all storage services.

Everything is Non-disruptive

- Downtime will cost a huge hidden cost when your unified storage hosts hundreds of applications. That is why keeping storage activities is a critical part of the business. For instance:
- Non-disruptive Hardware Upgrades and Replacement: All of the critical components include controller, fan module, or PSU in the XCubeNXT series are hotly pluggable for failover without downtime.
- Non-disruptive Software Upgrades: With smart failover, both controllers can take over all service when the other controller fails or doing an upgrade.
